

SuperGlue

Learning Feature Matching with Graph Neural Networks

1. A Learnable Middle-end

Our problem:

- Inputs: two sets of **local features** - keypoints & local descriptors
- Output: strong & outlier-free **matches**
- Applications: SLAM, SfM, visual localization

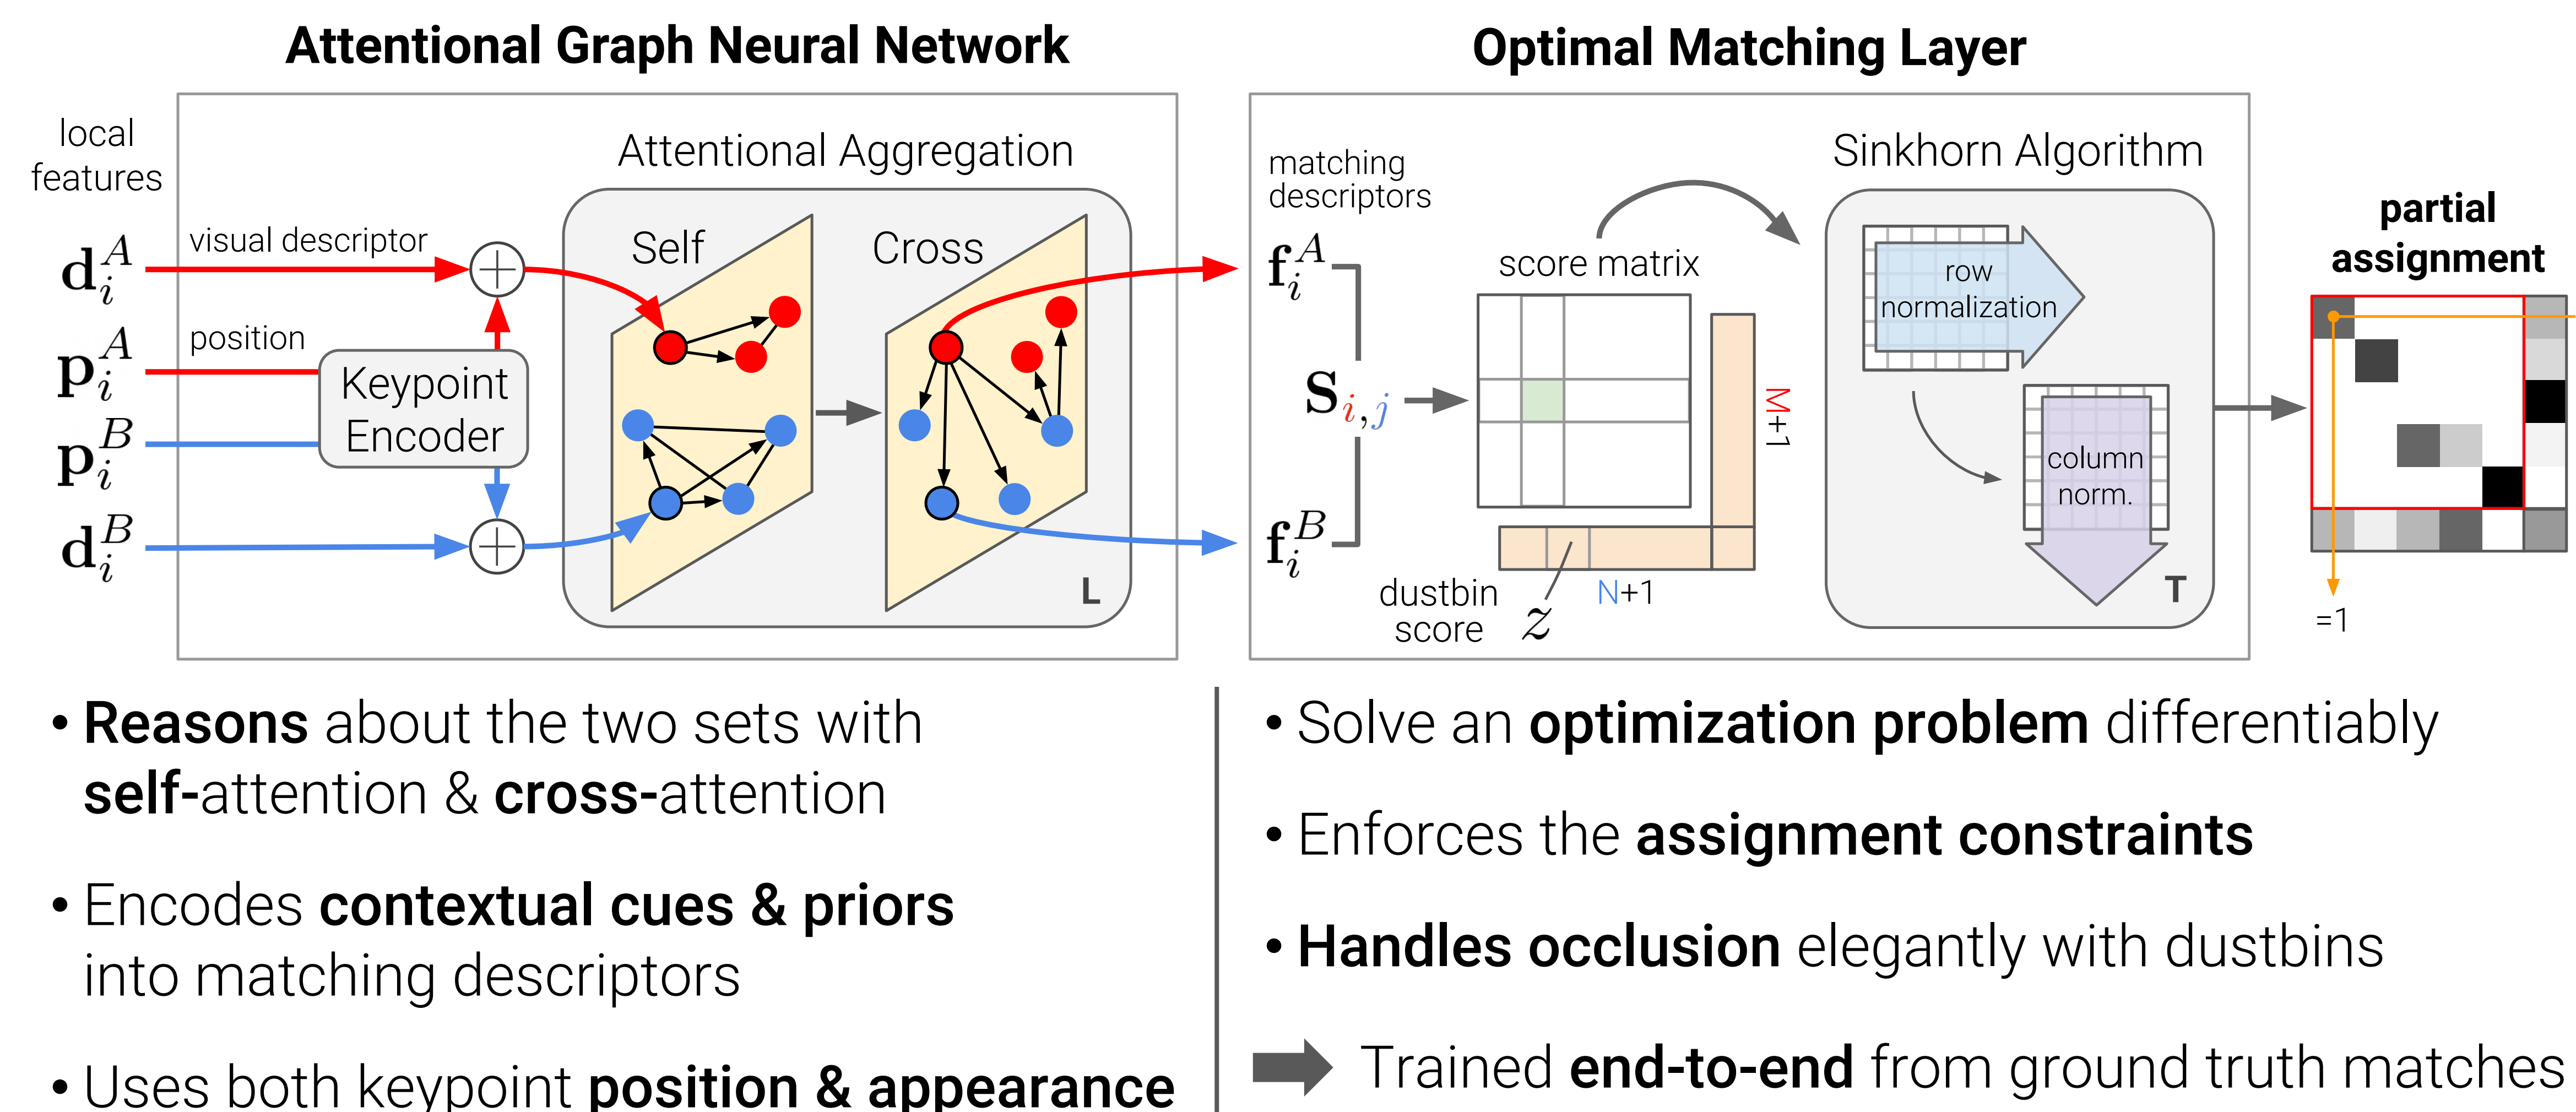

- Combine deep learning with classical optimization
→ **Graph Neural Networks, Attention, Optimal Transport**
- Robust**: handles **extreme wide-baseline** image pairs
- Real-time**: 15 FPS on GPU, scales to 1000s of keypoints
- SOTA matching** for **indoor+outdoor** with **SIFT & SuperPoint**
- Interpretable**: learn **complex reasoning & priors** about the world

SuperGlue: context aggregation + matching + filtering

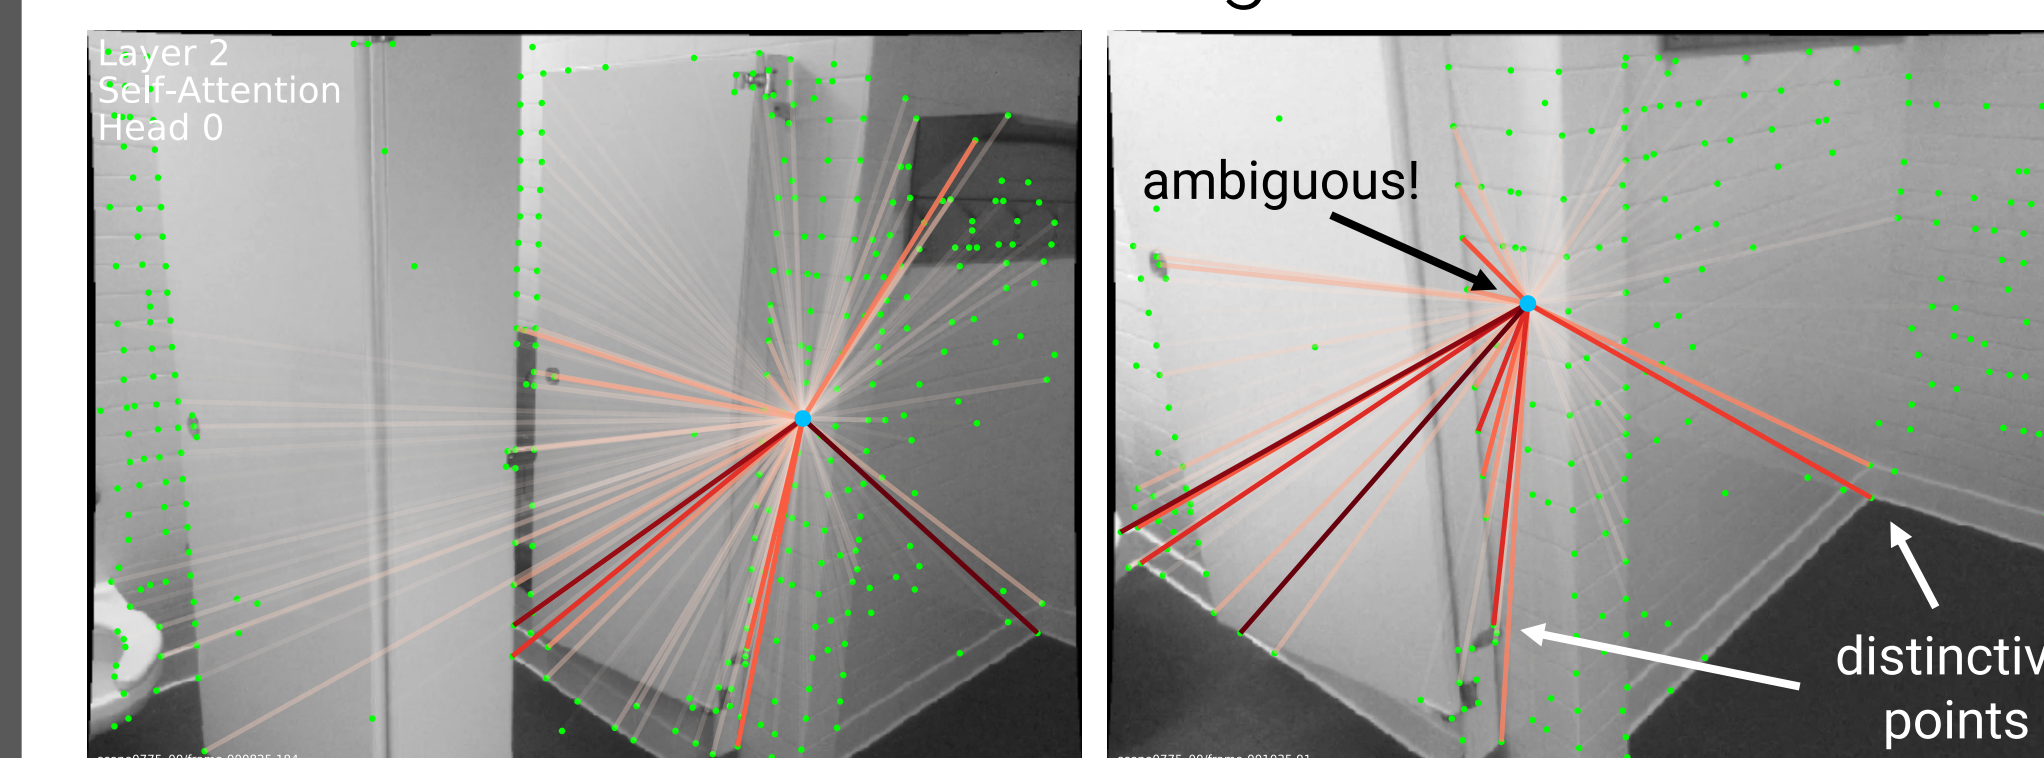

2. Graph Neural Network + Optimal Transport

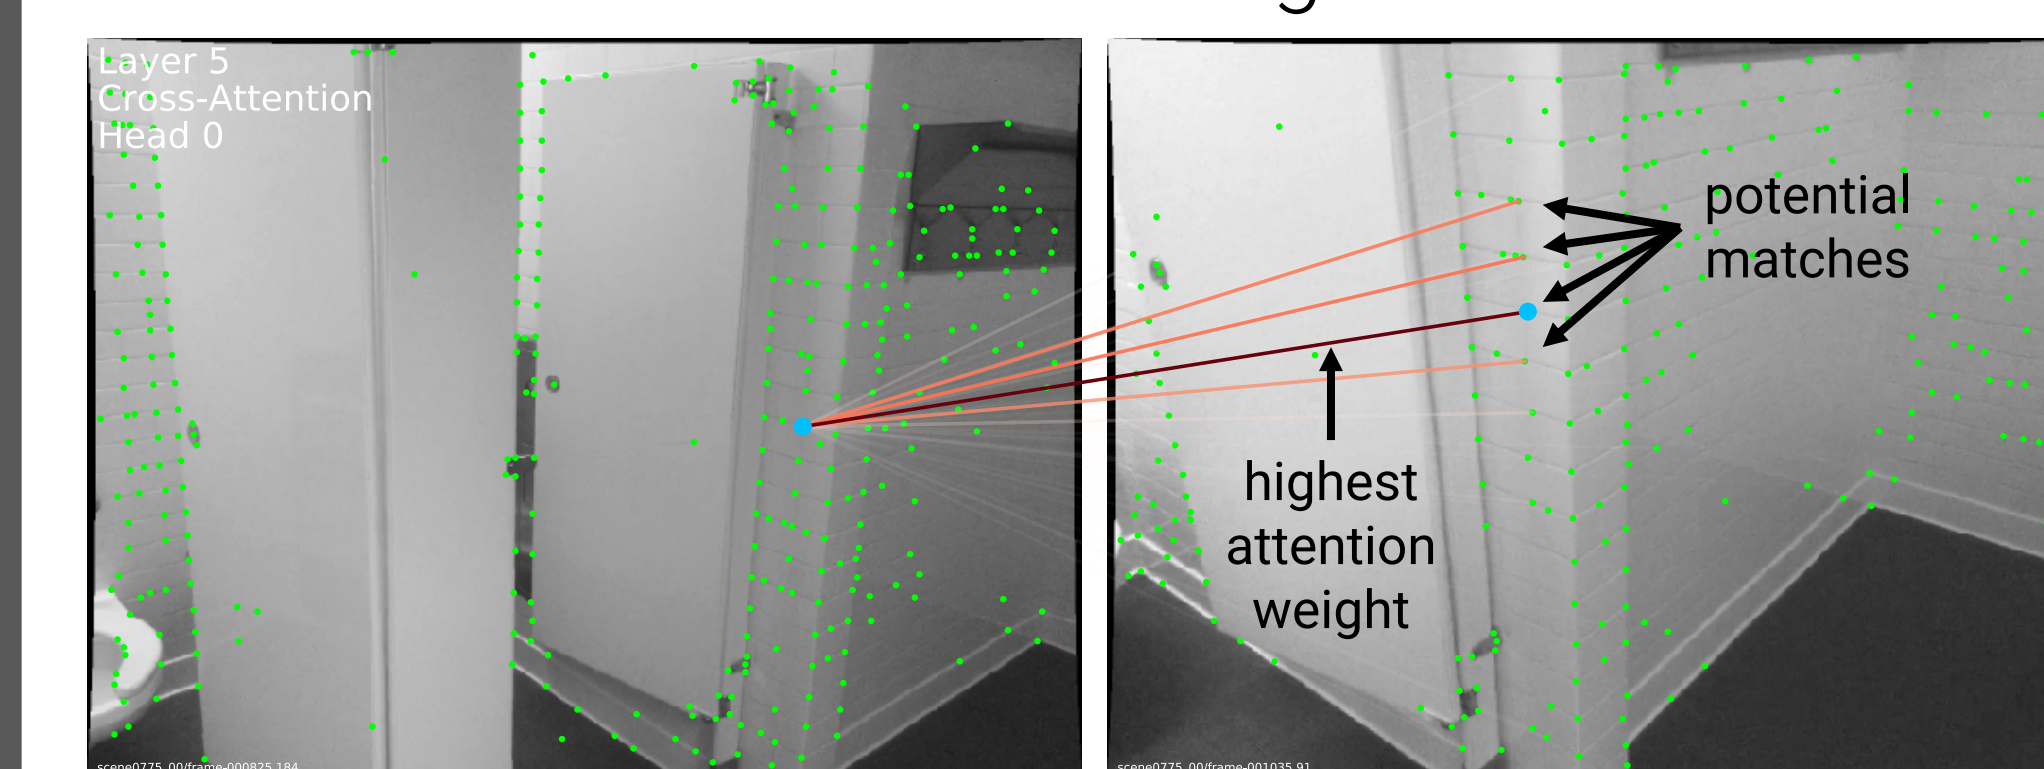

3. Interpretable

Self-attention = intra-image information flow

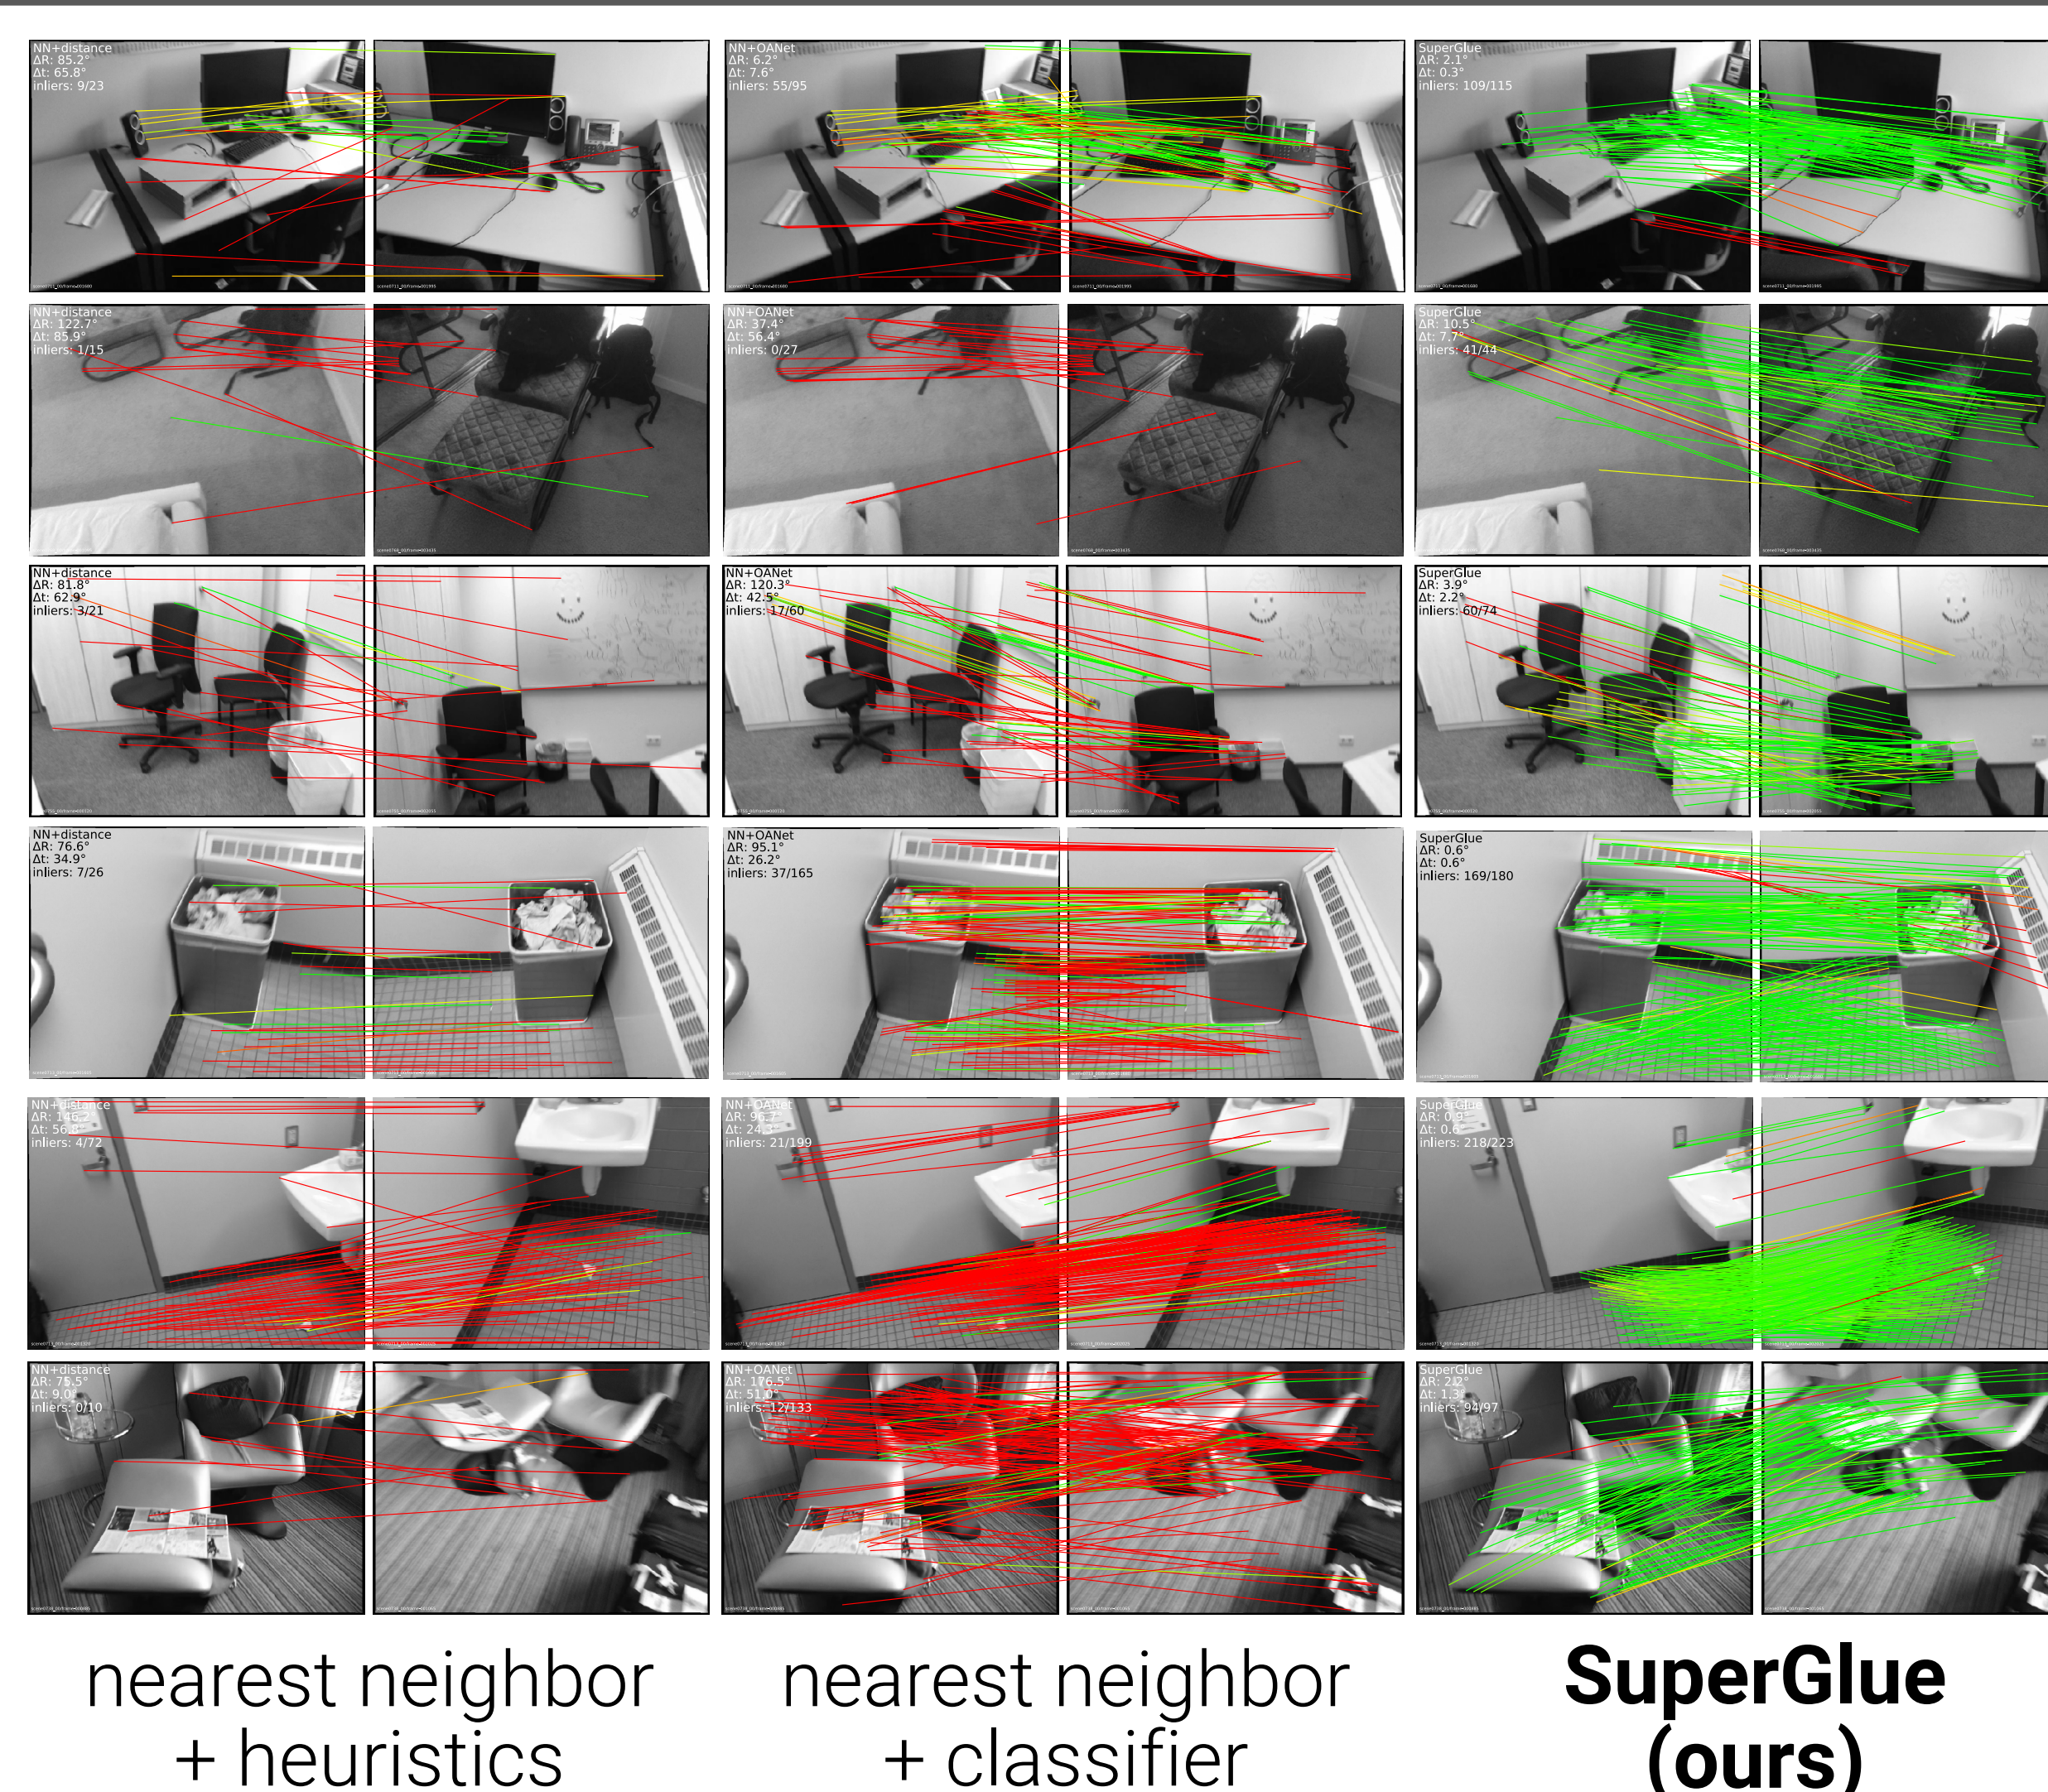

Cross-attention = inter-image communication

= a **soft, data-dependent, sparse graph** to better understand feature matching

4. Results: State-of-the-art Relative Pose Estimation

- SuperGlue > classifiers > heuristics
- SuperPoint + SuperGlue > all
- Generalizes well for SfM, localization
